

Toadflax Planting Guide

About Toadflax

A colorful wildflower, this little gem is an annual bloomer, gracing your fields and gardens with its multi colored display in spring and early summer. Toadflax is an easy to grow pollinator attractor!

When to Plant

Sow Toadflax seeds in the spring, after the final frost, as soon as the soil is able to be worked, but is still cool to the touch. Toadflax can also be started indoors 6-8 weeks before the final frost date in spring, after a 2-3 week period of cold stratification.

Where to Plant

Toadflax does well in full sun or partial shade conditions, in light, sandy soil that is well-draining. Ideal soil temperatures will range from 55-65 degrees F.

How to Plant

Direct sow seeds onto the surface of the soil, and firmly compress. Do not cover the seeds, as Toadflax requires sunlight in order to germinate. Seeds will germinate in approximately 14-21 days.

Caring for Toadflax

Once established, Toadflax is drought resistant and can thrive with very little care or maintenance. Toadflax will flower in spring all the way through fall, though will typically stop blooming during the hottest months. Toadflax will self-seed and propagate swiftly if left unattended. To prevent self-sowing, deadhead blooms as they begin to fade.
